

Exercice 2:

Let's go back to the written program and consider some changes.

1. How does the program behave if the user cheats by changing the number to find during the game?
2. Can we guarantee that the program ends and the user gives a valid indication (big, small, find)?
3. Allow the user to use the symbols ">" to mean too large, "<" to mean too small and "=" to mean found.
4. Instead of looking for the number between 1 and 999, we want to look for it between 1 and 9999. What modifications must be made? Normally there should only be one line to change!
5. The user should be able to abandon the game by answering 0 when the program waits for its response. The program should clearly state that the user has quit the game.
6. When the user requests to abort, the program must ask for confirmation before the abort is effective.
7. If the player is cheating, the program would have to ask the user for the number they chose and tell them when they made a mistake while evaluating the machine's suggestions.
